> More about ERGOTECH

Ergotech is specialized in production of thermoplastic components employed in many different sectors. Currently 90% of the components produced are for the automotive sector, however, over the years, Ergotech has worked in the biomedical sector, in the electrical and electronic field as well as in the household appliance industry.

Together with its partners, Ergotech monitors the whole process to produce each single component made of thermoplastic materials or composite polymers. Starting from the analysis of the customer's requirements to identify the best thermoplastic material to use, Ergotech design and make the mould in order to create the dedicated production area.
