## > More about ASPECHOME S.R.L.

Aspechome is an Italian startup founded in 2019 (part of Gruppo Marengo), offering an all in one Energy Smart System that optimizes photovoltaic energy usage in buildings for maximum self consumption, comfort, and cost savings. The platform combines Italian made hardware with a cloud based web app accessible on smartphones, tablets, and PCs. It provides real time monitoring of solar production, energy flows (consumption, grid import/export), and daily/monthly/yearly economic savings—ideal for homeowners, designers, and installers alike.

At its core are two international patents (EU and US) enabling intelligent, priority based load management: the system activates or deactivates appliances—such as heat pumps, HVAC units, chargers, and Wi-Fi outlets—based on available solar energy and pre set priorities, aiming for up to 100% autoconsumption without needing a battery bank
