CUBAR

> More about CUBAR

Thanks to an advanced engineering activity and the development of an automation platform we actualize solutions, identifying the means to solve the problem.

We select the suitable product/partner for the solution using simulations, verifications and pre-production tests. We carry out a safety assessment for integrating the requirements of international regulations and the suitability of the solution on the local legislatures.

We handle and control the smallest of industrial processes, lessening the need for human intervention and optimizing resources and costs. We provide the perfect solution where repeated - yet complex - operations are concerned, where a high level of safety is also required, as well as the confidence that a procedure will be carried out.
