

PROGIND

> More about PROGIND

PROGIND s.r.l. has been in the mould-building sector for over 40 years, specializing in the design, and construction of injection moulds as well as mass production of plastic parts. The company's technology and innovation enabled them through the years to operate in various fields: automotive, household appliances, small industrial parts and components, office machines and electronics.

The products designed and produced every day are small, extremely precise components, with surface finishing and aesthetic features.

Having manufactured injection moulds and high repeatability bi- and tri-injection moulds since many years, PROGIND is also involved in co-moulding with plastic and metal sheet inserts, moulding systems assisted by automatisms, blanking and deep-drawing and transfer moulding. But the real added value comes from the vertical integration that they can provide to their customers, which starts from co-designing and finishing such as painting, laser etching, chrome-plating, IMD or IML up to the semi-assembly of complex mechanical groups.
