

RISATTI INSTRUMENTS

RISATTI INSTRUMENTS

> More about RISATTI INSTRUMENTS

Risatti Instruments was founded in 1948 with the production of electric transformers. Until the 90s this was Risatti's main activity, which gave a specialization in problems related to testing of the field. In parallel, Risatti regularly interfaced with technicians from major industrial groups, as well as local artisans and small producers. This led the company to develop highly specialized testing systems, capable to satisfy the most varied operative needs.

Our testing equipment is exported worldwide.

Risatti boasts an efficient aftersales service, also via videoconference team up with the client at any stage.

Our proprietary software plays a fundamental role in every testing machine. It is entirely designed and realized in our plant, using LabView by National Instruments. In this way, possible future updating, modifications, and implementations of parts are guaranteed to the Customer.

Risatti Instruments mainly operates in the automotive, aerospace and smart manufacturing fields.
