

AIGLE MACCHINE

> More about AIGLE MACCHINE

Aigle began its activities in 1958 building machinery for the flocking of each type of application. During its first decade, Aigle considerably contributed to developing the technology of flocking, with particular reference to its application in the textile industry.

In 1968 Aigle started producing coating and lamination machinery which was considered to be the natural evolution of the previous products. At present Aigle produces and sells its machines worldwide.

Aigle partners with customers in the development of new projects, by supplying solutions for customization based on specific technical requirements.

The company massively invests in research and development, for updating and increasing the level of performance of their flocking, coating and lamination plants, as well as for the design of the plants and individual machines. The machines installed enable customers to face the challenges of an increasingly demanding market.

In over 50 years of business, Aigle has gained a wide experience in managing relationships with customers. Aigle offers ready and verified technical solutions to customers with precise and defined needs and technical requests; nonetheless, can it be considered a partner for developing new projects to face the ever more demanding and complicated market requests.
