> More about CFT RIZZARDI

Founded in 1987, CFT Rizzardi was created to study and implement new applications for cam handling systems. This activity leads to the successful development of several cam-driven products such as translators, elevators, and manipulators for use in automotive production lines, primarily.

Subsequently, the firm began to follow a new and successful path dedicating more of its activity to the design and production of Tool Changer Systems for machine tools.

Nowadays its production aims to develop the application of cam devices for the creation of automatic systems featured by fast, smooth and precise motions.

The current day product range is mainly made up of components and sub-assemblies for the machine tool industry and to a lesser extent, the production of cam handling systems for automation.
