## > More about Gamma impianti

Contamination due to infected aerosol is a new challenge in the field of air safety in medical context, as hospitals, clinics and any activity involving a direct contact between patient and healthcare professional. Exposure of healthcare professionals to microbes, virus and bacteria can be reduced by PPE. But as those are passive protection, they do not stop particles from scattering and transporting pathogens, polluting the environment and make it hard to sanitize.

Airsafe® filtration line includes mobile, stationary and centralized systems. All these already protect patient and healthcare professional successfully in any operation foreseeing patient/operator physical proximity, and – more importantly – during high-risk procedures, with aerosol emission.
