## > More about APTSol

Whether you require a simple emulsion, a nanonized powder or extremely complex polymeric matrix systems, APTSol will always apply its passion and expertise to obtain high quality products. Our knowledge of processes and formulations, together with the availability of advanced instrumentation, allows us to provide high added-value services that will contribute to the success of your products.

The APTSol team is characterized by a strong academic and professional experience in the formulation field, and is able to provide services that range from performing analyses to providing innovative and effective responses to the problems presented by our clients.

Especially in the food field APTSol possess knowledge and equipment for the development of gelled beads systems with the technique of ionotropic gelation (called also spherification). Such systems are generically spheroidal in shape, and are characterized by a diameter that can range between a few  $\mu\text{m}$  and some mm. Through such a technology, it is possible to encapsulate a great number of materials: such as food (vinegar, oil, algae, spirits) and fragrances.

Through this technique, our company can execute feasibility studies, formulation development, lab-scale production of particles and micro-particles.

APTSol mainly operates in the agrifood and health & wellness fields.
